Dear Hiring Manager,

In my last role, I was the lead frontend engineer for a project within MUFG and Union Bank to revamp their authorization and authentication system which was used prior to any/all high-risk transactions (potential for movement of money). In this role I had primarily worked with Typescript/Javascript and React, with external scripts written in Python and Java as needed (typically for interactions with AWS Lambdas or devops related tasks).

Prior to this I had worked within an early startup (HelpingMyFriend) that involved the creation of a platform designed to make it easier for people that are struggling in life to be provided aid. I had built the application from the ground up (including frontend, backend and devops) with features such as fundraising, meal-planning, work-party planning and potluck organizing tools for its users.

I'm very excited to hear back from you and learn more about this position.

Best,

Jaiden
